Abstract

The collections of the National Museum of Costa Rica contain a total of 7,895 specimens, corresponding to the Greater Metropolitan Area (GAM) and some peri-urban areas surrounding it. A total of 52 families, 264 genera and 452 species are also recorded, to which another 223 species are added reported in the databases of the Global Biodiversity Information Facility (GBIF), which were corroborated by bibliographic references and witnesses in other collections, for a final count of 674 species.

Keywords: Ants; Bees; Urban Insects; Wasps

Introduction

When I discuss the topic of urban insects with the non-scientific population of a region, it is very common to receive comments of rejection of groups of wasps and ants, as well as fear and curiosity about bees. It is fashionable to integrate some measures in favor of wild insect populations, such as bee hotels, butterfly host plants and trees. But even these concepts only bring to people's minds the image of one or two species of bees, colorful butterflies and little birds, but the reality of the composition of the entomofaunal community of an ecosystem is much more complex.

In Costa Rica, when working with the urban public, I have received comments such as that they have an "ant plague" in their house or garden, or that they have had to call the fire department to burn a wasp or bee hive, with the greatest concern mentioned to me being the safety of children and pets. In addition, environmental education and urban ecology research programs do not have specific information on the taxonomic composition of urban areas, based on which they can develop educational material for the

management and conservation of these specific species that, in the end, remain wild and therefore linked to the current wildlife conservation law.

This article documents the most common species of Hymenoptera in the GAM, considering all families of the order and including only observations from the last 25 years, as well as species that have backup specimens from the National Museum of Costa Rica.

Methodology

Nomenclatures:

MNCR-A: National Museum of Costa Rica, Arthropods collection.

BBSL: Agricultural Research Service, Bee Biology and Systematics Laboratory collection.

CBG: Centre for Biodiversity Genomics

SEMC: Snow Entomological Museum Collection

MNB: Museum für Naturkunde Berlin, Alemania

GBIF: Global Biodiversity Information Facility

Study Area

The list was made within the limits of the Greater Metropolitan Area and a sector of the peri-urban area (Figure 1). All specimens of the order Hymenoptera present in the MNCR collection were considered, as well as the records present in the GBIF database with specimens in BBSL, CBG, SEMC and MNB.

The INaturalist records were excluded because they did

not have specimens in the collection and it is very difficult to validate the identification of the species from photographs, due to the complexity of the taxonomy, but it is not ruled out that many of these observations can be validated in the future. Likewise, the oldest records from the year 2000 were not considered, because the presence of these species cannot be validated today, as the landscape has changed a lot in recent decades.

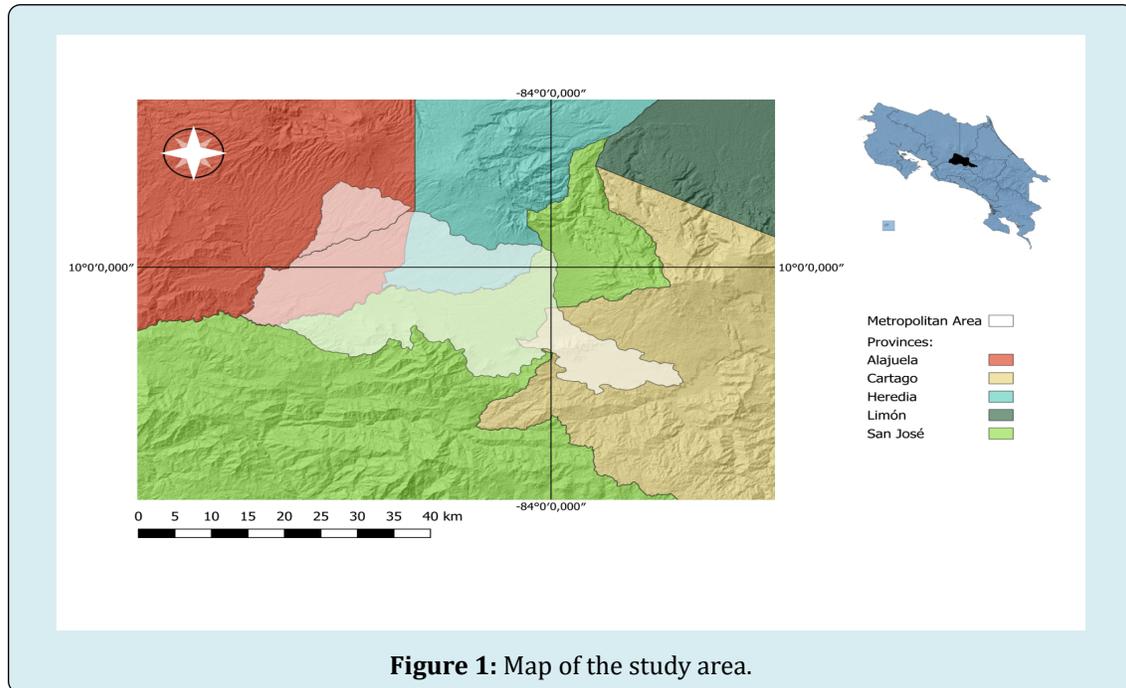

Figure 1: Map of the study area.

Results

Considering the GBIF records and the 7895 specimens

found in the MNCR collection, a total of 674 species were recorded, detailed below:

Familia	Especie	Endemismo	Testigo / Referencia
Agaonidae	<i>Pegoscapus tonduzi</i>	No endemic	Ramírez-Benavides, et al.
Ampulicidae	<i>Ampulex angusticollis</i>	No endemic	MNCR-A 5034806
Andrenidae	<i>Protandrena sp.</i>	No endemic	MNCR-A 66561
Aphelinidae	<i>Aphelinus abdominalis</i>	No endemic	CBG- sin número de catálogo
Apidae	<i>Apis (Apis) mellifera</i>	No endemic	MNCR-A 585457
Apidae	<i>Bombus (Fervidobombus) digressus</i>	No endemic	MNCR-A 4185350
Apidae	<i>Bombus (Fervidobombus) mexicanus</i>	No endemic	MNCR-A 5057936
Apidae	<i>Bombus (Fervidobombus) pullatus</i>	No endemic	MNCR-A 4080181
Apidae	<i>Bombus (Pyrobombus) ephippiatus</i>	No endemic	MNCR-A 5057920
Apidae	<i>Bombus (Robustobombus) volucelloides</i>	No endemic	MNCR-A 4030091
Apidae	<i>Centris (Aphemisia) agiloides</i>	No endemic	BBSL- sin número de catálogo

Apidae	<i>Centris (Centris) adani</i>	No endemic	BBSL- sin número de catálogo
Apidae	<i>Centris (Centris) obscurior</i>	No endemic	BBSL 14873
Apidae	<i>Centris (Centris) varia</i>	No endemic	BBSL 14759
Apidae	<i>Centris (Hemisiella) nitida</i>	No endemic	BBSL 16159
Apidae	<i>Centris (Hemisiella) trigonoides</i>	No endemic	BBSL 16181
Apidae	<i>Centris (Hemisiella) vittata</i>	No endemic	BBSL 15004
Apidae	<i>Centris (Heterocentris) terminata</i>	No endemic	BBSL 16142
Apidae	<i>Centris (Ptilocentris) festiva</i>	No endemic	MNCR-A 5134662
Apidae	<i>Centris (Trachina) fuscata</i>	No endemic	BBSL 16134
Apidae	<i>Centris sp.</i>	No endemic	MNCR-A 1204949
Apidae	<i>Cephalotrigona zexmeniae</i>	No endemic	BBSL 26830
Apidae	<i>Ceratina sp.</i>	Indeterminado	MNCR-A 585668
Apidae	<i>Ceratina (Zadontomerus) ignara</i>	No endemic	BBSL 15081
Apidae	<i>Eufriesea concava</i>	No endemic	MNCR-A 1008036
Apidae	<i>Eufriesea pallida</i>	No endemic	MNCR-A 4336844
Apidae	<i>Eufriesea sp.</i>	No endemic	MNCR-A 4080178
Apidae	<i>Euglossa (Euglossa) deceptrix</i>	No endemic	BBSL 6725
Apidae	<i>Euglossa (Euglossa) dilemma</i>	No endemic	SEMC 152106
Apidae	<i>Euglossa (Euglossa) townsendi</i>	No endemic	MNCR-A 1015959
Apidae	<i>Euglossa (Euglossa) tridentata</i>	No endemic	MNCR-A 4011384
Apidae	<i>Euglossa (Euglossa) variabilis</i>	No endemic	MNCR-A 4262821
Apidae	<i>Euglossa (Euglossa) viridissima</i>	No endemic	MNCR-A 3931166
Apidae	<i>Euglossa (Glossura) imperialis</i>	No endemic	MNCR-A 1008051
Apidae	<i>Euglossa (Glossura) ignita</i>	No endemic	MNCR-A 4353804
Apidae	<i>Euglossa (Glossurella) bursigera</i>	No endemic	MNCR-A 4361266
Apidae	<i>Euglossa (Glossurella) sapphirina</i>	No endemic	MNCR-A 4334053
Apidae	<i>Euglossa sp.</i>	No endemic	MNCR-A 4003911
Apidae	<i>Eulaema (Apeulaema) cingulata</i>	No endemic	MNCR-A 5002352
Apidae	<i>Eulaema (Apeulaema) polychroma</i>	No endemic	MNCR-A 3832020
Apidae	<i>Eulaema (Apeulaema) speciosa</i>	No endemic	MNCR-A 5002213
Apidae	<i>Eulaema (Eulaema) luteola</i>	No endemic	MNCR-A 1008049
Apidae	<i>Eulaema (Eulaema) meriana</i>	No endemic	MNCR-A 4353796
Apidae	<i>Eulaema marcii</i>	No endemic	MNCR-A 4099585
Apidae	<i>Exaerete frontalis</i>	No endemic	MNCR-A 5002463
Apidae	<i>Exaerete smaragdina</i>	No endemic	MNCR-A 979403
Apidae	<i>Exomalopsis (Exomalopsis) badioventris</i>	No endemic	BBSL 22036
Apidae	<i>Exomalopsis (Exomalopsis) fumipennis</i>	No endemic	BBSL 22045
Apidae	<i>Exomalopsis (Exomalopsis) mellipes</i>	No endemic	BBSL 22390
Apidae	<i>Exomalopsis (Exomalopsis) similis</i>	No endemic	BBSL 22059
Apidae	<i>Exomalopsis (Exomalopsis) tepaneca</i>	No endemic	BBSL 22107

Apidae	<i>Florilegus sp.</i>	No endemic	MNCR-A 5002791
Apidae	<i>Geotrigona acapulcornis</i>	No endemic	MNCR-A 5134571
Apidae	<i>Geotrigona lutzi</i>	No endemic	MNCR-A 585478
Apidae	<i>Melipona (Michmelia) costaricensis</i>	No endemic	MNCR-A 4185362
Apidae	<i>Melipona (Melikerria) beecheii</i>	No endemic	BBSL 4502
Apidae	<i>Nannotrigona mellaria</i>	No endemic	MNCR-A 4291012
Apidae	<i>Nannotrigona perilampoides</i>	No endemic	MNCR-A 585672
Apidae	<i>Oxytrigona mellicolor</i>	No endemic	MNCR-A 4353813
Apidae	<i>Paratetrapedia albipes</i>	No endemic	BBSL 8007
Apidae	<i>Paratetrapedia calcarata</i>	No endemic	BBSL 8253
Apidae	<i>Paratetrapedia sp.</i>	Indeterminado	MNCR-A 5134829
Apidae	<i>Partamona orizabaensis</i>	No endemic	MNCR-A 4158334
Apidae	<i>Scaptotrigona pectoralis</i>	No endemic	MNCR-A 4209406
Apidae	<i>Scaptotrigona subobscuripennis</i>	No endemic	MNCR-A 4158342
Apidae	<i>Tetragona dorsalis</i>	No endemic	MNCR-A 5010402
Apidae	<i>Tetragonisca angustula</i>	No endemic	MNCR-A 585663
Apidae	<i>Thygater (Thygater) analis</i>	No endemic	MNCR-A 5002764
Apidae	<i>Thygater sp.</i>	No endemic	MNCR-A 439539
Apidae	<i>Trigona corvina</i>	No endemic	MNCR-A 585460

Table 1: Hymenoptera species of the GAM.

Discussion

Over the last few decades we have seen a significant increase in publications related to a decline in insect species, but few of them really have a monitoring-type backing to demonstrate the decline process. For this, two important pieces of information are necessary: a list of species carried out in an exhaustive manner through monitoring, which is truly representative of the geographic area in question, and a cover study that shows that between two different points in time there was a process of loss of vegetation cover.

In this regard, the GAM of Costa Rica does not have either of these two elements to really define whether there has been a displacement of species due to urban growth, especially since many restoration, conservation and protection projects of vegetation cover have been developed in many areas. Given this uncertainty, the first step in this matter that can be provided is a list of species reported to date, based on which other ecological studies can base their identification and either add species or confirm their presence and absence in

the study.

However, since this list included species supported by other collections, and reports from other researchers for which the specimen is not available to corroborate its identification, the following measures were taken:

Regarding Endemism

Within the Apidae and Halictidae families there are several specimens identified at the genus level, but it is important to emphasize that within these groups there are endemic species to which these specimens could belong; for example, for Apidae, there are specimens of bees belonging to the genus *Ceratina* Latreille, 1802, which has 18 species in the country, 5 of them endemic, namely: *C. fumipennis*, *C. singularis*, *C. aeneiceps*, *C. claripennis* and *C. abdominalis*, so it is not possible to define their endemism.

A similar case occurs for the following genera *Paratetrapedia* Moure, 1941, which has seven species

reported for Costa Rica, within which *P. albilabris* is endemic; For the Halictidae family, the Augochlora genus Smith, 1853 presents 14 for Costa Rica, three of which are endemic: *A. obscuriceps*, *A. fulgidiana* and *A. fulvilabris*; the Augochloropsis genus Cockerell, 1897 presents five species reported for the territory, three of which are endemic: *A. cyanescens*, *A. johannae* and *A. pallitarsis*. Caenaugochlora Michener, 1954 presents seven species reported for the territory, four of which are endemic: *C. costaricensis*, *C. leoi*, *C. beethoveni* and *C. donnae*.

There is also the case of the Sphecodes genus Latreille, 1804, which presents only two species reported for Costa Rica: *S. aeneiceps* and *S. clupeatu*, both endemic; However, it is a group with so few serious studies that it should not be determined as endemic without an identification at the species level because there is no in-depth review that rules out the presence in the territory of other species reported for Central America that would not be endemic and are already suspected to be present due to their distribution ranges.

Regarding Data Extracted from GBIF

Since this catalogue contains species data extracted from GBIF online databases, it is important to point out the following cases regarding this data:

- There are 44 specimens identified as *Partamona cupira* (Smith, 1863) reported for Costa Rica; however, this species is endemic to Brazil, so the identification is erroneous [1-3].
- In BBSL there are 25 specimens of *Paratetrapedia albipes* Friese, 1916, which is a synonym of the species *Lophopedia pygmaea* (Schrottky, 1902).
- Since it is evident that the identifications have not been reviewed and updated, records prior to the year 2000 were omitted, because the physical changes in the GAM have been significant in recent years, in terms of habitat loss, so it cannot be corroborated without a witness specimen that the species continues in the area and has not been displaced to peri-urban areas outside the study polygon, to which is added that many of them are identified as species that do not correspond to the indicated distribution, which makes the identification unreliable, and it is necessary to corroborate the specimen.
- All observations that do not have a specimen from the collection were omitted, because it is not scientifically correct to use this type of records for the following reasons: the data in the photograph or the data provided may be altered, the person making the identification may be wrong and there is no specimen with which to corroborate the information.
- The species *Ancyloscelis apiformis* (Fabricius, 1793) was not added because, although Costa Rica is within

its range of distribution, there is no way to verify its identification.

- The species *Anthophorula parva* (Timberlake, 1980) (Andrenidae), is not included in the official catalogue of Neotropical species, and in other taxonomic portals such as Ecdysis, it is recorded for the United States and Mexico.
- The species of the *Centris* genus (Apidae) were taken into account, because their biology and distribution is quite wide, and they were already reported for Costa Rica.
- The *Ceratina (Zadontomerus) ignara* (Apidae) was included because it is supported by the MNB, corresponding to a Syntype collected in the province of San José and is also supported by the article by Flores-Gómez, et al. [4]
- The species of the families Eupelmidae, Evaniidae, Figitidae, Encyrtidae, Crabronidae, Braconidae and Ichneumonidae collected between 2000 and 2020 were included because they were supported by the CBG and the scientists: D. Janzen, W. Hallwachs, R. Zuniga, A. Telfer, K. Perez and R. Miskie, and also by scientific publications [5-8].
- The records of Formicidae, also collected between 2000 and 2020, were also included because of their support by the scientists P.S. Ward and J. Longino, as well as the Antweb platform that has continuous and updated support and review.
- The species *Cephalotrigona zexmeniae* and *Melipona (Melikerria) beecheii* (Apidae) and the two species of the genus *Paratetrapedia* were included because their distribution does fit with that established in the literature.
- The five species of the genus *Exomalopsis* (Apidae) were included, because their biology and nesting requirements can effectively allow viable populations at present [9,10].
- The genus *Calliephialtes* Ashmead, 1900 (Ichneumonidae) appears three times with “f”, “q” and “zz” instead of the species name, so it was only counted once as “*Calliephialtes* sp.”
- The species “*Clistopyga k*” (Ichneumonidae) from GBIF was omitted, because it is not a valid species and 3 valid species of this genus are already reported with a control specimen in the MNCR collection.
- The name *Procryptocerus carbonarius laeviventris* Forel, 1899 is a synonym of *Procryptocerus batesi* Forel, 1899.
- The genus *Pyramica* Roger, 1862 is a synonym of *Strumigenys* Smith, 1860.
- The name *Pseudomyrmex alfari* Forel, 1906 is a synonym of *Pseudomyrmex nigrocinctus* (Emery, 1890).
- The genus *Zacryptocerus* Wheeler, 1911 is a synonym of *Cephalotes* Latreille, 1802.

Conclusions

1. This list may increase as other species reported before 2000 can be confirmed in the study area, proving that they are still there, since due to urban expansion it is very possible that many have been displaced.
2. This is only a preliminary reference list, it may vary over time and due to the extension of the GAM, not all species may be present throughout its territory, but rather there may be differences in altitudinal and latitudinal distribution.
3. It is also concluded that there may be many species that have not yet been fully recorded, because sampling would require entering private properties, which makes the work very difficult, so as it is a preliminary list it should not be taken as an absolute basis but as a reference to know which species are confirmed for the region.
4. By omitting observations without taxonomic support, the risk of including misidentified taxa was minimized; Likewise, it is concluded that the records of digital platforms may not be up to date, so it is recommended to be very cautious regarding their use, since the older the data, the less reliable the identifications are, especially when there is no physical copy to confirm or correct them.
