Abstract

There are no many contemporary studies of hormonal cycles with large periodicity, like Pribram's studies of EEG periodicity of 7 to 8 years. However, the hormonal cycles with periodicity of 7 years for females and 8 years for males described in ancient acupuncture texts make full sense. During the growth and development of the girls when the hormones grow a seven-year cycle is obvious with hormonal rearrangement at age 7 when the girls change their teeth, at age 14 when their menstrual period starts, at age 21 when their wisdom teeth appear. This is followed by a period of stable hormonal content with two more hormonal rearrangements at age 28 and 35. It is followed by a period of hormonal decline with hormonal rearrangements at age 42 and 49 (7x7) when the menstrual period stops and the women cannot give birth to children any more. The same changes take place in the male body with periodicity 8 years and finishes at age 64 (8x8) when men cannot be sexually active any more. The precision of our life planning speaks of super-intelligent wise Creators.

Keywords: Hormonal Cycles; Female 7-Year Hormonal Cycles; Male 8-Year Hormonal Cycles; Female Hormonal Rearrangement; Male Hormonal Rearrangement

Introduction

Years ago, Prof. Karl Pribram reported at a conference that they found periodicity in the EEG with a period of repetition 7 to 8 years. I told him that if he would split the genders, he would get 7-year periodicity for females and 8-year periodicity for males. I know this from ancient Chinese texts, which claim that the development of girls (females) is ruled by hormonal rearrangements with periodicity 7 years and the development of boys (males) is ruled by hormonal rearrangements with periodicity 8 years. I don't know if Prof. Pribram did studies with splitting of the genders or not.

Hormones and Hormonal Rhythms

The name "hormone" come from the Greek word "hormao", which means "exciting", because the first

discovered hormones were exciting - depleted in amount mg per litter blood they were exciting the whole body. Later, it was discovered that there are substances, which in amount mg per litter blood were inhibiting the functioning of the whole body. They were also called hormones, which is not right. Should we name the hormones according to their function, we should name them "essence of life" (as they are called in the ancient Chinese texts) because in amount mg per litter blood they rule and regulate everything in the body by exciting or inhibiting. In the ancient Chinese book on acupuncture Huang Ti Nei Ching Sue Wen [1] the hormones are called "essence of life".

Every hormone is secreted at certain time of day or night and the periodicity of depletion varies from hours to years. The hormonal cycles with short periodicity are well studied, but the hormonal cycles with long periodicity (years) are

poorly studied. Such is the case of long-term hormonal rearrangement in the female body with 7-year periodicity of change and the long-term hormonal rearrangement in the male body with 8-year periodicity of change.

Female Hormonal Rearrangements with Periodicity 7 Years

Looking at the development of girls, we can clearly see the hormonal rebalancing every 7 years, which bring dramatic changes in girls' bodies: at age 7 the girls change their teeth, at age 14 their menstrual period starts and they become physiologically ready to reproduce, at age 21 the wisdom teeth appear and they become psychologically mature women [2]. The hormonal rearrangements at ages 7, 14, and 21 are 3 points of evolution through revolution- they are 3 singularity points on the line of constant hormonal and physical growth [2].

The 7-year cycle of hormonal rearrangement continues in the female body, but after age 21 the hormonal content remains the same (it is a horizontal line) with 3 singularity points of hormonal rearrangements at ages 21, 28, and 35. At age 35, a hormonal decline starts with another 3 singularity points of hormonal rearrangements at ages 35, 42, and 49. At age 49 (7x7) the menstrual period stops and with this stops the ability to reproduce, i.e. to give birth of children [2].

Male Hormonal Rearrangements with Periodicity 8 Years

Looking at the development of boys, we can clearly see the hormonal rebalancing every 8 years, which bring dramatic changes in boys' bodies: at age 8 the boys change their teeth, at age 16 the secretion of semen starts and they become physiologically ready to reproduce, at age 24

the wisdom teeth appear and they become psychologically mature men [2]. The hormonal rearrangements at ages 8, 16, and 24 are 3 points of evolution through revolution-they are 3 singularity points on the line of constant hormonal and physical growth [2].

The period of 8-year cycle of hormonal rearrangement continues in the male body, but after age 24 the hormonal content remains the same (it is a horizontal line) with another 3 singularity points of hormonal rearrangements at ages 24, 32, and 40. At age 40, a hormonal decline starts with another 4 singularity points of hormonal rearrangements at ages 40, 48, 56, and 64. At age 64 (8x8) the depletion of semen stops and with this stops the ability to reproduce [2].

Conclusion

Thus, while the development of the female body consists of cycles with 7-year periodicity and each cycle finishes with drastic hormonal changes that bring drastic changes in their female bodies as if turning a new page of their development, the development of the male body consists of cycles with 8-year periodicity and each cycle finishes with drastic hormonal changes that bring drastic changes in their male bodies as if turning new page of their development. The mathematical precision of this planning strikes with its precision and speaks about wise a priory planning by Super-intelligent wise Creators.
